

# Burndown Chart

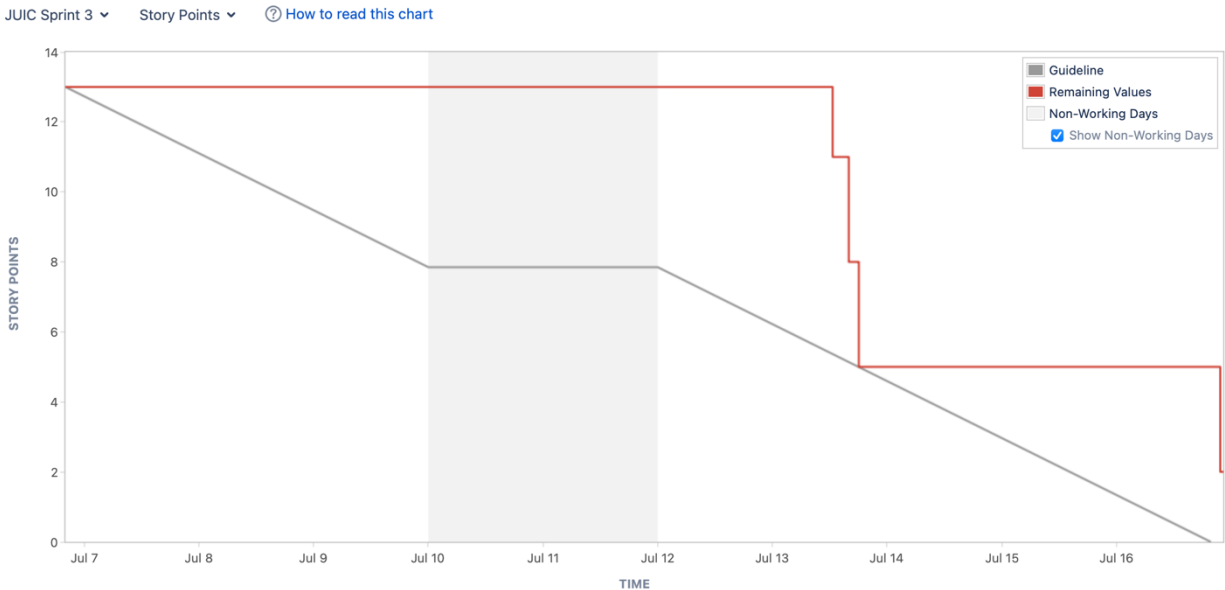

## Sprint 1

## Sprint 2

## Sprint 3

In sprint 1 it seems that we had an even velocity throughout the entire sprint. In comparison, in sprint 2 it seems we completed most tasks in the final 2 days of the sprint. I think this is due to most people in our group being busy with midterms during sprint 2, which is why we finished most of our tasks in the later portion of the sprint.

On average each task for sprint 2 was also bigger than the average task for sprint 1, which also could have led to a longer completion time.

In sprint 3 we only started working on our tasks during the weekend as that was when we were all free. This is why our graph is unchanged for most weekdays, and has a sharp decline on the weekend. On the weekend we completed a lot of smaller tasks such as routes and schemas, that attributed to a large amount of completed story points. In the last 2 days of the sprint we finished a lot of housekeeping tasks such as documentation and Swagger endpoints.

We were also unable to finish the JUIC-32 user story (Task JUIC-57). This was because the JUIC-31 user story was heavier than expected and required a lot of extra tickets for backend routes.
